Constantina Tripon

I am currently employed at Colibo A/S, developing a software solution using .NET framework, SSMS for data storage, and Azure DevOps for CI/CD. This experience has provided me with a solid foundation to further develop my skills in software development.

I specialize in integrating systems and managing user imports from various sources, including Azure and Active Directory. I am confident that these skills would allow me to contribute to any work environment, improving project workflows and increase the efficiency of the development processes.

My daily tasks include closely collaborating with stakeholders to design and plan data imports, implementing code, conducting tests, providing user support for challenges related to software functionality, and deploying intranet solutions on client servers, including installation, configuration, and post-launch support.
